## **INTEGRATED CIRCUITS**

# DATA SHEET

# **74F85**4-bit magnitude comparator

Product specification

1994 Sep 27

IC15 Data Handbook

# **Philips Semiconductors**

74F85

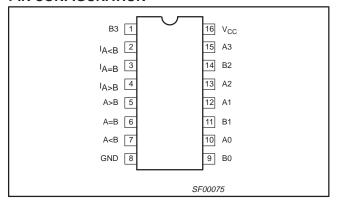

#### **FEATURES**

- High-impedance NPN base inputs for reduced loading (20μA in High and Low states)
- Magnitude comparison of any binary words
- Serial or parallel expansion without extra gating

#### DESCRIPTION

The 74F85 is a 4-bit magnitude comparator that can be expanded to almost any length. It compares two 4-bit binary, BCD, or other monotonic codes and presents the three possible magnitude results at the outputs. The 4-bit inputs are weighted (A0-A3) and (B0-B3) where A3 and B3 are the most significant bits. The operation of the 74F85 is described in the Function Table, showing all possible logic conditions. The upper part of the table describes the normal operation under all conditions that will occur in a single device or in a series expansion scheme. In the upper part of the table the three outputs are mutually exclusive. In the lower part of the table, the outputs reflect the feed-forward conditions that exist in the parallel expansion scheme. The expansion inputs  $I_{A>B}$ , and  $I_{A=B}$  and  $I_{A<B}$ are the least significant bit positions. When used for series expansion, the A>B, A=B and A<B outputs of the lease significant word are connected to the corresponding  $I_{A>B},\,I_{A=B}$  and  $I_{A< B}$  inputs of the next higher stage. Stages can be added in this manner to any length, but a propagation delay penalty of about 15ns is added with each additional stage. For proper operation, the expansion inputs of the least significant word should be tied as follows:  $I_{A>B} = Low$ ,  $I_{A=B}$  = High, and  $I_{A<B}$  = Low.

#### **PIN CONFIGURATION**

| TYPE  | TYPICAL<br>PROPAGATION<br>DELAY | TYPICAL<br>SUPPLY CURRENT<br>(TOTAL) |
|-------|---------------------------------|--------------------------------------|
| 74F85 | 7.0ns                           | 40mA                                 |

#### ORDERING INFORMATION

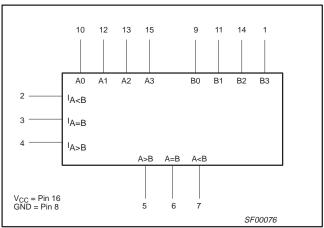

| DESCRIPTION        | COMMERCIAL RANGE $V_{CC}$ = 5V $\pm 10\%$ , $T_{amb}$ = 0°C to +70°C | PKG DWG # |  |  |
|--------------------|--|-----------|--|--|
| 16-pin plastic DIP | N74F85N  | SOT38-4   |  |  |
| 16-pin plastic SO  | N74F85D  | SOT162-1  |  |  |

## INPUT AND OUTPUT LOADING AND FAN OUT TABLE

## **APPLICATION**

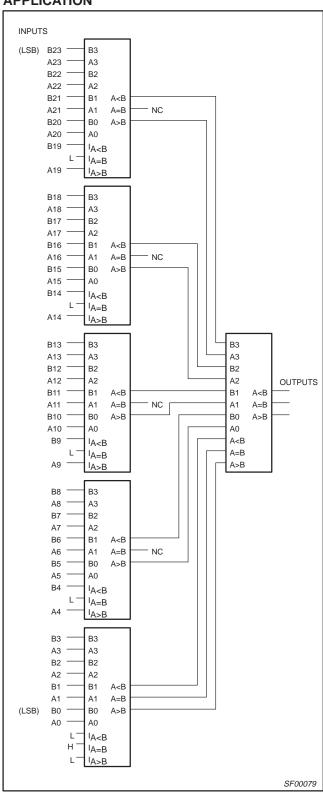

Figure 1. Comparison of Two 24-Bit Words

The parallel expansion scheme shown in Figure 1 demonstrates the most efficient general use of these comparators. The expansion inputs can be used as a fifth input bit position except on the least significant device, which must be connected as in the serial scheme. The expansion inputs used by labeling  $I_{A>B}$  as an "A" input,  $I_{A<B}$  as a "B" input and setting  $I_{A=B} = Low$ . The 74F85 can be used as a 5-bit comparator only when the outputs are used to drive the (A0–A3) and (B0–B3) inputs of another 74F85 device. The parallel technique can be expanded to any number of bits as shown in Table 1.

Table 1.

| WORD LENGTH | NUMBER OF<br>PACKAGES | TYPICAL SPEEDS<br>74F |  |  |
|-------------|-----------------------|-----------------------|--|--|
| 1-4 bits    | 1                     | 12ns                  |  |  |
| 5–24 bits   | 2–6                   | 22ns                  |  |  |
| 25–120 bits | 8–31                  | 34ns                  |  |  |

## NOTES:

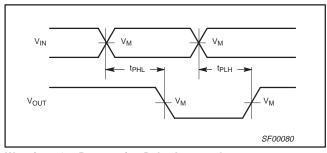

- 1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at V<sub>CC</sub> = 5V, T<sub>amb</sub> = 25°C.
   Not more than one output should be shorted at a time. For testing I<sub>OS</sub>, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, IOS tests should be performed last.

## **AC WAVEFORMS**

Waveform 1. Propagation Delay Input to Output

NOTE:

For all waveforms,  $V_M = 1.5V$ .

see AC ELECTRICAL CHARACTERISTICS for value. Load capacitance includes jig and probe capacitance; see AC ELECTRICAL CHARACTERISTICS for value. Termination resistance should be equal to  $Z_{\text{OUT}}$  of

pulse generators.

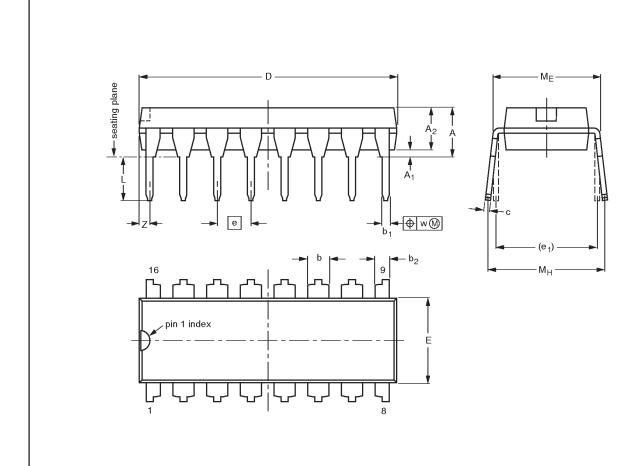

| family | INPUT PULSE REQUIREMENTS |                |           |                |                  |                  |  |  |  |  |  |

#### Data sheet status

| Data sheet status         | Product<br>status | Definition [1]  |
|---------------------------|-------------------|---|
| Objective specification   | Development       | This data sheet contains the design target or goal specifications for product development. Specification may change in any manner without notice.   |
| Preliminary specification | Qualification     | This data sheet contains preliminary data, and supplementary data will be published at a later date. Philips Semiconductors reserves the right to make chages at any time without notice in order to improve design and supply the best possible product. |
| Product specification     | Production        | This data sheet contains final specifications. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.  |

<sup>[1]</sup> Please consult the most recently issued datasheet before initiating or completing a design.

#### **Definitions**

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

#### **Disclaimers**

**Life support** — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
